

Selective mask readout calibration through predicted correction benefit

Target journal: Pattern Recognition Letters.

Document status: Complete scientific draft for author review; not submitted.

CRediT contributions by author: _____

Data/code release destination: _____

Known data and implementation sources

The study uses COCO train2017 and val2017 annotations and images, COCO-pretrained Ultralytics YOLO26m-seg and YOLO26s-seg weights, and Ultralytics 8.4.100. The manuscript's reproducibility package references the completed result runs and contains the frozen calibration models and relevant source code. Dataset images and segmenter weights are not bundled.

Generative AI assistance recorded for this draft

OpenAI Codex (GPT-6) assisted research-protocol development, Python implementation, literature checking, manuscript organization and drafting, and plotting code. Figures are produced with deterministic plotting or image-overlay code from existing results and source images. No AI-generated experimental images or fabricated measurements are used. The final authors must review the text and code, specify their contributions, and complete their own responsibility declaration before submission. This document does not assert that this review has already occurred.
