

Fixed-direction QCR displacement diagnostic

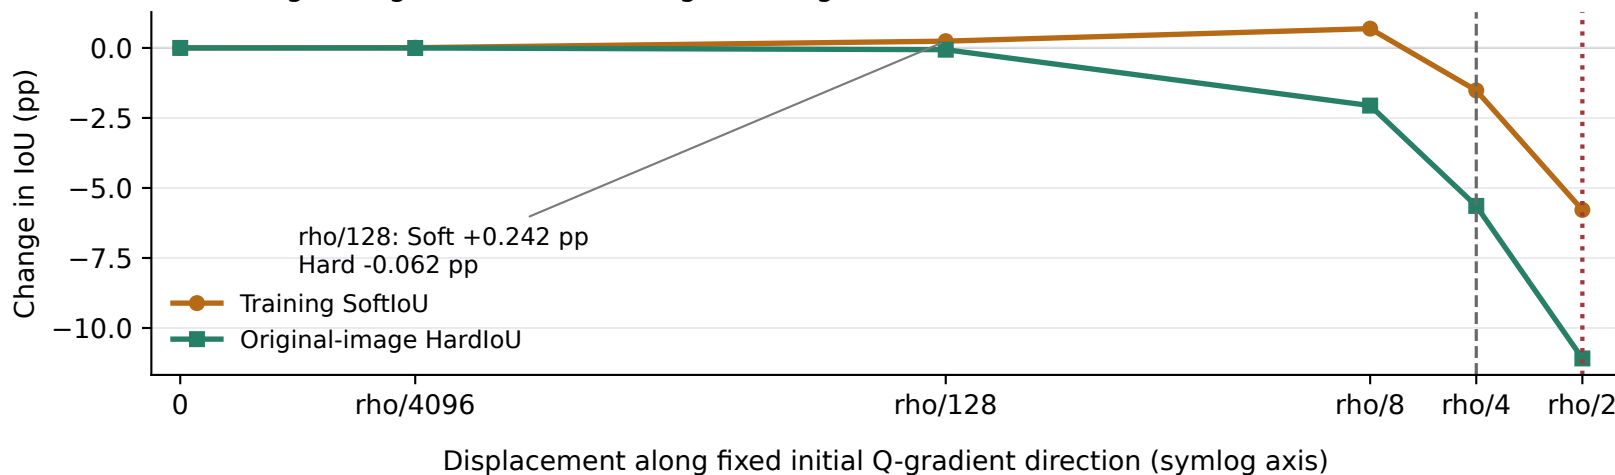

Fixed first 64 DEV images | baseline success $n = 323$ (63 images)

Candidate micro means of paired changes from c_0 | diagnostic only; no step selection

a Learned quality score

b Training surrogate and normal original-image decode

Same candidates at all six probes. Lines connect observed points; they do not imply measured intermediate states.
Success training max refers to Success perturbations only. No method benefit or generalization claim.
